Abstract.- Schistosomiasis is an important disease in the tropics with huge impact on the socio-economic development of affected regions. The study aimed to investigate the antischistosomal and hepatoprotective activity of Morus alba leaves extract. Mice were allocated to eight groups. Group I served as vehicle control. Groups II, II and IV were gavaged with 100 µl of 200, 400 and 800 mg/kg mulberry leaves extract, respectively for 10 days. Groups V, VI, VII and VIII were infected with 100×10 Schistosoma mansoni cercariae. On day 46 p.i. with S. mansoni, the animals of group VI, VII and VIII received 100 µl mulberry extract by gavage once daily for 10 days at a dose of 200, 400 and 800 mg/kg body weight, respectively. All mice were sacrificed at day 55 post-infection. Worm recovery and egg counting in the hepatic tissues were determined. S. mansoni was able to induced inflammation and injury of the liver. This was evidenced (i) as increases in granuloma size, (ii) as increased production of nitric oxide and malondialdehyde, and (iii) as lowered glutathione levels. All these infection-induced parameters were significantly altered during mulberry treatment. Based on these results, it is concluded that mulberry could ameliorate preexisting liver damage and oxidative stress conditions due to schistosomiasis.

Key words: Schistosoma mansoni, Morus alba, liver, schistosomiasis, hepatoprotective activity.

INTRODUCTION

Schistosomiasis remains one of the most prevalent parasitic infections in the world and is endemic in more than 75 countries (World Health Organization, 2010). More than 10% of the world’s population – are at risk of being infected with schistosomiasis and approximately 207 million people in tropical and subtropical zones are infected with this disease (Steinmann et al., 2006; World Health Organization, 2010). Laboratory animals have been frequently used as a model for the analysis of pathological studies in human infection (Cheever et al., 2002). The reference drug for treatment of schistosomiasis is praziquantel (PZQ), however, in Egypt, some patients received three doses of PZQ failed to be completely cured (Ismail et al., 1999).

Medicinal plants have been useful in the development of new drugs and continue to play an invaluable role in the drug discovery processes (Farnsworth, 1994). Some medically important plant species as Zingiber officinale, Nigella sativa and Asparagus officinalis show an effect against schistosomiasis (Hoareau and Dasilva, 1996; Tanwer and Vijayvergia, 2010).

M. alba L. of Moraceae family (mulberry) has long history of use in Chinese oriental medicine. It is claimed that almost all parts of this plant is useful in cardiovascular, liver and spleen disorders (Fukai et al., 2003). Recent research has shown that this herb has free radical scavenging activities, hypolipidemic, antioxidant, antibacterial, antiviral, astringent, emollient and antiinflammatory properties (El-Beshbissy et al., 2006; Du et al., 2003; Chung et al., 2003). Mulberry leaf contains triterpenes (lupeol), sterols (β-sitosterol), bioflavonoids (rutin, moracetin, quercetin-3-triglucoside and isoquercitrin), coumarins, volatile oil, alkaloids, amino acids and organic acids (Doi et al., 2001).

Since the liver plays a vital role in maintaining health and in the same time is highly susceptible to disease and injury, we designed the current study to investigate the hepatoprotective effect of mulberry leaves against Schistosoma mansoni infection in mice.
MATERIALS AND METHODS

Animals
Swiss albino mice were bred under specified pathogen-free conditions and fed a standard diet and water ad libitum. The experiments were performed only with male mice (25-30 g) at an age of 9-11 weeks and were approved by state authorities and followed Saudi Arabian rules for animal protection.

Infection of mice
*S. mansoni* cercariae were from Schistosome Biological Supply Center at Theodor Bilharz Research Institute, Imbaba, Giza, Egypt. Mice were exposed to 100±10 *S. mansoni* cercariae per mouse by the tail immersion method, modified by Oliver and Stirewalt (1952).

Preparation of the mulberry leaf extract
Fresh matured leaves of *Morus alba* tree were collected from Riyadh, Saudi Arabia. The samples were authenticated by Dr. Jacob Thomas (Botany Department, College of Science, King Saud University, Saudi Arabia) on the basis of taxonomic characters and by direct comparison with the herbarium specimens with a voucher number KSU-11272 available at the herbarium of Botany (King Saud University, Saudi Arabia). Mulberry leaf extract was prepared according to the method described by Mohammadi et al. (2012) with some modification. Air-dried powder (100 g) of mulberry leaves were extracted by percolation at room temperature with 70% methanol and kept at 4 °C for 24 h. The obtained extract was concentrated under reduced pressure (bath temperature 50°C) and dried in a vacuum evaporator. The residue was dissolved in distilled water, filtered and used in our experiment.

Experimental design
Animals were allocated to 8 groups of eight mice each and treated as mentioned in Table 1.

Mice were infected with 100±10 *S. mansoni* cercariae. On day 45 p.i. with *S. mansoni*, the animals of the infected groups received 100 µl of *M. alba* extract by gavage once daily for 10 days. On day 55 p.i with *S. mansoni*, the animals of all groups were sacrificed.

Livers from infected and non-infected control animals were aseptically removed from mice, cut up in small pieces, washed in sterile physiological saline, and rapidly frozen and stored at -80 °C, if not otherwise stated. Part of the liver was weighed and homogenized in a PRO Scientific D-Series Benchtop homogenizer in order to prepare a 50% (w/v) homogenate in an ice-cold medium containing 50 mM Tris-HCl and 300 mM sucrose (Tris-sucrose buffer). The initial homogenate was centrifuged at 500xg for 10 min at 4°C. The supernatant was diluted 1:10 with the Tris-sucrose buffer to give 10% and was then used for the various biochemical determinations.

Perfusion and worm recovery
Mice were sacrificed nearly at the end of the eighth week post exposure (day 55 p.i.); Schistosome worms were recovered from the hepatic portal and mesenteric veins by perfusion technique described by Smithers and Terry (1965).

Egg count in the liver
The eggs in the liver of infected mice were counted according to Pelligrino et al. (1962). In brief, the number of eggs per gram of liver tissue was determined by weighing a piece of liver (0.1 g) and divided it into four fragments, each fragment crashed between a slide and cover slip. The fragments were examined by light microscope.

Granuloma size
Tissue samples of the liver of all groups were immediately fixed after animal dissection in 10% neutral buffered formalin, dehydrated and processed for paraffin sectioning. Sections were then deparaffinized, stained with hematoxylin and eosin.
The instances were also induced a highly significant reduction rate of 26% and 46%, respectively (Table II). Moreover, mice treated with mulberry (200 mg/kg) displayed a highly significant increase in egg reduction, estimated by 2180±101 egg/ g liver (Table II).

RESULTS

Analysis of the parasite at day 55 p.i. showed differences in the total number of the recovered worms in all the infected-treated mice compared to the infected-untreated one (Table II). Mulberry treatment with 200, 400 and 800 mg/kg significantly affect the worm burden with a reduction rate of 40%, 26% and 46%, respectively (Table II). Moreover, mice treated with mulberry (200 mg/kg) displayed a highly significant increase in egg reduction, estimated by 2180±101 egg/ g liver (Table II).

Granulomas were marked by concentric fibrosis with many fibroblasts encircled the trapped eggs. Mulberry administration induced a significant reduction in the size of granuloma compared to infected nontreated one (Figs. 1, 2). The granuloma diameter reached approximately 405±26 µm in infected livers. Mulberry treatment with 200, 400 and 800 mg/kg could significantly reduce the granuloma diameter to 250±19, 230±19 and 260±22 µm, respectively (Fig. 2).

S. mansoni also induced a highly significant increase in hepatic NO and MDA (Table III) by approximately 1.5 fold. However, mulberry induced no significant reduction in the S. mansoni-induced increase in both MDA and NO, respectively (Table III).

S. mansoni induced a significant (P ≤ 0.05) decrease in the level of glutathione in the liver of mice (Fig. 3). Treatment with 200 and 800 mg/kg of

Mulberry rescued the reduced level of glutathione caused by *S. mansoni* (Fig. 3).

**DISCUSSION**

Liver is the largest organ in the vertebrate body and the site for intense metabolism. It plays an astonishing array of vital functions in the maintenance and performance of the body. Granulomatous inflammations in the liver serve a protective role by walling off and eliminating invaders and irritants, cavitation and fibrosis often aggravate the pathology of the disease (Boros, 1978). Administration of mulberry for 10 days has a pronounced antischistosomal activity where it diminished granuloma sizes extensively and...
decreased the number of involutive granulomas as compared with the infected control mice. These findings might suggest a possible antifibrotic role of mulberry. Also, the histological examination revealed a notable suppression in the granulomatous diameter.

Schistosomiasis is associated with liberation of free radicals and disturbance in the cellular antioxidant system. It has been revealed that there is an important role of antioxidant processes in mediating liver injury in schistosomiasis due to an increased production of reactive oxygen intermediates (La Flamme et al., 2001). Hence, the suppressive effect of mulberry on granuloma formation is probably due, in part, to the fact that mulberry has antioxidants effect (Du et al., 2003; El-Beshbishy et al., 2006). The leaf of mulberry contains triterpenes (lupeol), sterols (β-Sitosterol), bioflavonoids (rutin, moracetin, quercetin-3-triglucoside and isoquercitrin), coumarins, volatile oil, amino acids and organic acids (Doi et al., 2001).

It has been reported that schistosomiasis caused an impairment of liver GSH content of mice (Cunha et al., 2012). Decreasing the antioxidant capacity of the liver, leading to the generation of lipid peroxides that may play a major role in the pathology associated with schistosomiasis (Cunha et al., 2012). In the present study, hepatic GSH decreased significantly in infected treated mice as compared with the normal control group, which indicates that schistosomiasis causes more liberation of free radicals. Here, mulberry is seen to be the most effective antioxidant as shown in the present study. Mulberry decreased hepatic lipid peroxidation and GSH depletion. GSH plays an important role in antioxidant defense directly through scavenging of reactive oxygen species and indirectly through functions as a cofactor of antioxidant enzymes (Franco et al., 2007).

Indeed, infections cause an inflammatory response in the liver of mice. This response manifests itself as a perturbed liver structure and as a significant production of NO (Chang and Chen, 2005). Raso et al (2001) have viewed that the oxidative stress is mainly due to NO produced by the stimulated iNOS.

In the present study, it was observed that the infection caused significant increases in the hepatic MDA levels. Mulberry treatment prevented the increase in MDA, probably in part by scavenging the very reactive components. Moreover, high rate of oxidative processes, formation of hepatic MDA due to the peroxidative damage to the liver.
microosomal membrane lipid and impairment of the antioxidant defense characterize schistosomiasis (El Shenawy et al., 2008). Collectively, our data indicate that mulberry exhibits a significant antioxidant and anti-schistosomal activities, protecting host tissue from injuries induced by parasites.

ACKNOWLEDGMENTS

The authors extend their appreciation to the Deanship of Scientific Research at Majmaah University for funding the work through the research group project No. 4. Also, we would like to thank Dr. Amira Anwar and Dr. Marwa Salah (Zoology Department, Faculty of Science, Helwan University, Egypt) for the help in optimization of some experiments.
